Data Report for

Title	**Self-Infliction of Pain Increases Unrealistic Optimism but not Risk-Taking** (This is Chapter 4 of How Hwee Ong's PhD Dissertation)

Organization

Authors	How Hwee Ong Rob Nelissen Ilja van Beest
Affiliation	Department of Social Psychology Tilburg University
Email	h.h.ong@tilburguniversity OR howhwee88@gmail.com
Ethical clearance	Yes
Preregistration	Yes: https://osf.io/r7cuj/?view_only=e625c74032ef4e8fab4fb88526b9f4a9

Research Context

Description	Past research has found that when people witness undeserved suffering of others, there is a tendency to exhibit a form of magical justice beliefs where they expect that the victims of suffering would be compensated with future rewards in impossible ways. However, whether or not this expectation would also generalize to their own suffering remained an open question. In Study 1, we found that participants who chose to self-inflict physical pain became more unrealistically optimistic about their chances of winning a random lottery, suggesting that they expected their decisions to suffer pain would be rewarded in impossible ways. In Study 2, we examined if this expectation would translate to greater risk-taking on a financial risk task, but our findings did not support this – participants who chose to self-inflict physical pain did not take greater risks.
Kind of data	Survey (quasi-experimental) data
Publication	This is Chapter 4 of How Hwee Ong's PhD dissertation. It is not currently published in a peer-reviewed journal, but may be submitted for peer-review at a later time.
Keywords	Tilburg university, social psychology

Data production

Producer	Tilburg University
Production date	14 July 2021
Method	Study 1: A study conducted on undergraduates during a lecture Study 2: Amazon Mechanical Turk workers
Universe	General population

Data source	N.A.
Country / Nation	Study 1: Netherlands Study 2: United States

Rights and restriction

Restrictions (file permission)	Public
License	CC-BY
Rights	N.A.
Data retention period	10 years
